

Thai Kraft investment

William Kenyon's recent threading equipment installation on PM5 at Thai Kraft's Kanchanaburi site in Thailand has seen the mill's investment deliver improvements in both paper tail threading and carrier rope life.

The installation consisted of two vertical carrier rope tensioner units and one horizontal unit in the speed sizer and

William Kenyon vertical tensioner

after-dryer section. The units are fitted with William Kenyon dual tension controls which provide a higher tension during paper tail threading and a lower tension during normal machine running. This flexibility ensures a combination of maximum carrier rope life and optimum paper tail carrying ability.

The take-up capacity of all William Kenyon tensioners is calculated using the company's expertise and knowledge of carrier rope performance within each section based on specific machine conditions.
