

New ... low cost rope tensioner

William Kenyon has recently introduced a low cost tensioner to complement its full specification tensioner product range and the company has already received its first UK order.

The new unit has been designed with rodless cylinders and a reduced frame. It is aimed particularly at machines running at lower speeds and in positions where space is limited.

Andy Barnes, Sales Manager, commented, "Over the last few years we have identified a clear demand for a tensioning system which caters for the specific requirements of machines with severe space restrictions and/or where

Low cost tensioner from William Kenyon

limited running speeds mean that the capabilities of a full specification tensioner are not required. The addition of this new tensioner design means that William Kenyon has a rope threading solution to suit all positions and all budgets."

The rodless design lends itself to all systems - whether single, two or three ropes - and can be installed either horizontally or vertically with minimal changes to the support framework. The new tensioner is being supplied through William Kenyon's UK operation in Dukinfield, Cheshire whilst the full specification tensioner units will continue to be supplied from its USA subsidiary.
